4-Way Reversing Valves

- Wide Application Range
- High Reliability
- Minimum Pressure Drop
- Low Leakage Risk
- UL Approved

Application and Principle of Operation

The 4-way Reversing Valve is the key component to provide Heating and Cooling from the system to the air conditioned space by reversing the flow direction of refrigerant.

It is used at room air conditioners, packaged and central air conditioners.

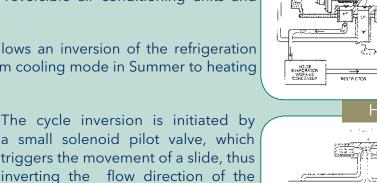

The reversing Valves are designed for Heat Pump Systems with capacity from 3kW to 580kW. They are suitable for most refrigerants as R407C - R410A - R134A.

Coil energized

The 4-way valves are used in reversible applications such as heat pumps or reversible air conditioning units and chillers.

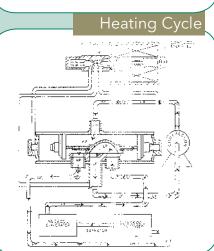

The 4-way valve allows an inversion of the refrigeration cycle, changing from cooling mode in Summer to heating mode in Winter.

refrigerant.

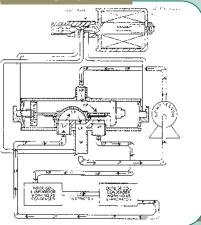

The valve is connected to the suction and discharge pipes.

The pilot valve ensures a very reliable changeover from cooling to heating mode; the changeover happens instantaneously with a minimum pressure differential.

Cooling Cycle

Cooling Cycle

The valve design also guarantees a minimum pressure drop and very low risk of leakage.

The models offer a wide range of connection sizes, configurations and capacity for specific applications. The standard models are available in small quantities per box providing increased flexibility.

Coil de-energized

Heating Cycle

Installation and Cautions

Notice

Heat pumps and heat/cool units:

many original equipment manufacturers connect the system tubing to the Ranco reversing valve based on which mode (heat or cool) the system will operate, should the solenoid coil fail.

For example, solenoid coil energized for cooling (Figure 1); solenoid coil failure mode to heat cycle.

Solenoid coil energized for heating (Figure 2); solenoid coil failure mode to cooling cycle.

Prior to replacing the valve, confirm which mode (heat or cool) the solenoid coil controls when energized.

Viewed facing three tubes and solenoid on right.

Solenoid coil fails, cycle goes to heating. Solenoid coil energized for cooling (de- energized for heat); solenoid fails, valve goes to heat cycle.----

- 1. Connects to Compressor Discharge
- 2. Solenoid Coil Energized for Cooling
- 3. Connects to Outside Condensor
- 4. Connects to Suction Line
- 5. Connects to Inside Evaporator (coil)

ure 1

Solenoid coil fails, cycle goes to cooling.

(de-energized for cooling); solenoid fails,

Solenoid coil energized for heat

valve goes to cooling cycle.

6. Solenoid Coil Energized for Heat

REPLACING VALVE ASSEMBLY

SYSTEM REPAIR - Follow the original equipment manufacturer's recommendations for replacement of refrigerant components.

SYSTEM EVACUATION - Follow original equipment manufacturer's recommendations and/or RSES SAM Section 83 (630-46).

COMPRESSOR MOTOR BURNOUT - Follow original equiment manufacturer's recommendations and/or RSES SAM Section 91.

CAUTION

To prevent possible electrical shock or equipment damage, disconnect electrical power to unit before and during installation.

DO NOT restore electrical power to unit until the device is properly installed.

GENERAL INSTALLATION PROCEDURES - REMOVAL

- Use only an oxy-acetylene torch to unsolder connections. Other type torches may not have the heat capacity to do the job with minimum time and temperature.
- Protect the valve from excessive heat. Temperatures above 110°C are apt to damage internal parts. Wrapping a wet rag around the valve body while using the torch will help to dissipate heat.
- Inadequate heat is also a problem.

Not only will the soldered joints be difficult to separate, but also the build up of heat over the longer period of time required will transfer to the valve body and possibly damage its internal parts.

• The joint should separate in seconds, not minutes. Use enough heat to accomplish this, while relying on the wet rag to protect the valve body.

Also remember that the remelt temperature of any solder alloy is much higher than the initial soldering temperature.

• After removing the valve, inspect the lines to make sure they are round and do not have any large solder blobs, which will interfere with the mechanical fit of the new joints.

VALVE INSTALLATION

• Avoid any rough handling of the new valve during installation. This especially includes the use of vise-type pliers to manipulate the valve body while

CAUTION

Protect tubes from entry of all foreign matter such as moisture, metal filings, dust or dirt. It takes only a tiny bit of scale,

flux, lint or the like to clog a pilot valve

- Use wet rags around the valve body and adjoining tubing to prevent overheating. Direct the flame of the torch away from the valve body. Excess heat over 110°C may distort internal parts.
- Use low temperature brazing rod as local code will permit, and use an inert gas to prevent oxide scale on the inside of the tubing.
- Preferably use a phosphorus-bearing silver solder which requires no external flux. The entrance of even a tiny bit of flux may be enough to damage a new valve
- If you must use silver solder with externally applied flux, be sure the sections to be joined are bright and clean and that you use the flux sparingly. This will do the job, but because this kind exceptional skill and care in its use, most valve manufacturers are reluctant to recommend it.

Choosing the correct Solenoid Coil

RANCO offers Type LDK and LDL solenoid coils for use with the entire range of RANCO Heat Pump Reversing Valves. These color coded epoxy encapsulated, continuous duty, moisture resistant magnetic coils are designed to operate the pilot valve controlling the Reversing Valves listed above.

Coil Type	Color	Voltage	Eromunanau	Wattage	UL Thermal	Cable lenght		
Con Type	Coloi	voltage	Frequency	50/60Hz Class	mm	inch		
LDK-11	Red	12V~	50/60Hz	5/4	А	1200	48	
LDK-31	Black	120V~	50/60Hz	5/4	А	1200	48	
LDK-41	Green	208 / 240V~	50/60Hz	5/4	А	1200	48	
LDK-73	Yellow	12V	-	10	F	1200	48	
LDK-83	Orange	24V	-	10	F	1200	48	

Other cable length available on request. Included with the LDK solenoid coil is a W29 wiring harness with 120 mm leads.

Coil Type	Color	Voltage	Frequency	Wattage	UL Thermal	Cable lenght

These solenoid operated Reversing Valves are slide type, 4-way with a 4-way Pilot valve and operate under the full pressure of the heat pump system.

The valves are used on unitary, split system, and window-type heat pump applications. There are six different styles designed to meet your particular system need.
